MySQL connection with JPA

Development:

Marcelo Eduardo Guillen Castillo

Java Monterrey Academy

August 30, 2024

Introduction

In order to make use of JPA and its miracles, we need to create a database where our information will be modified by our Java program, and then install on our project the Spring Boot and JPA dependencies, it is recommended to use Maven to manage our dependencies and plugins.

Connection

We need a SQL Server running on the PC, and tell our program where it needs to connect to, in order to make modifications into the database. Also it needs a user to access the database.
We need to first create the user, the database and the table with its values, so we need to run the sql file that is on the project.
